TARGET

This International Symposium FDMD, joining the fourteenth International SF2M Spring Meeting, is the second in a series initiated in Trondheim, Norway may 2011.

Like in the first edition, it is focused on the influence of defects on the fatigue and durability of structural materials. This is an important scientific issue with significant human and financial implications.

All materials are concerned. The main objective is to understand the impact of a given defect population on the fatigue behaviour from a material optimization point of view (i.e. the link with the material elaboration and manufacturing process) and also from a design optimization perspective (i.e. definition of an allowable defect size).

POSTERS

Participants have the opportunity to present posters discussing fatigue studies in progress. Students have been encouraged to present their initial results or their scope of work in order to have the opportunity to interact with the fatigue community.
